In Room 20 we have been exploring the concept of **MEASUREMENT**.

We know that measurement is about **comparing**, **using** and **describing** size.

We also know that we can measure **objects**, **events** and **spaces**.

An example of an **object** is a table, an example of an **event** is playing a game of cricket and an example of a **space** is our classroom.

We are also exploring the many **measurable attributes** of objects, events and spaces, such as **length**, **time** and **area**.

Please visit our classroom for more information about measurement!
